TEST IV

PART I

Part I consists of 6 questions. Clearly write your answer (only) in the space provided after each question. You do not need not to show your work for this part of the test. No partial credit is awarded for this part of the test!

Each question is worth 5 points.

Question 1

Find all the critical numbers of the function $f(x) = \frac{1}{4}x^4 - \frac{9}{2}x^2$.

Answer:

Question 2

The function $f(x) = x^2 - 5x$ satisfies the hypotheses of the Mean Value Theorem on the interval $[0, 5]$. Find the number c that satisfies the conclusion of the Mean Value Theorem.

Answer:

Question 3

Find the absolute maximum value of the function $f(t) = t^2 - 3t$ on the closed interval $[-1, 3]$.

Answer:

Question 4

Find the open interval on which the function $g(x) = x^5 - 80x + 3$ is decreasing.

Answer:

Question 5

Find the part of the x -axis on which the function $h(x) = xe^{-x}$ is concave up.

Answer:

Question 6

Find the most general antiderivative of the function $f(x) = 1 + e^{-x} + \sin x$.

Answer:

PART II

Each problem is worth 14 points.

Part II consists of 5 problems. You must show your work on this part of the test to get full credit. Displaying only the final answer (even if correct) without the relevant steps will not get full credit.

Problem 1

Suppose that the derivative of a function $f(x)$ is given by

$$f'(x) = (x - 4)^2(x + 1)^5(x - 3)^6.$$

Answer all the following questions.

- (a) Find all the critical numbers of the function $f(x)$.
- (b) On what interval(s) is the function $f(x)$ increasing? (Justify your answer!)
- (c) On what interval(s) is the function $f(x)$ decreasing? (Justify your answer!)

Problem 3

- (1) Find the dimensions of a rectangle with perimeter 300 ft and whose area is as large as possible.

- (2) Find two positive numbers whose product is 121 and whose sum is minimal.

Problem 4

- (a) Find the most general antiderivative of the function

$$f(x) = 18x^2 - 9x^{4/5} + 17\sqrt{x}.$$

(Simplify your answer!)

- (b) Find the most general antiderivative of the function

$$f(x) = \frac{1}{x} + e^{2x} + \frac{1}{\sqrt{1-x^2}}.$$

Problem 5

An object moves along a straight line with acceleration

$$a(t) = \sin t - \cos t.$$

Use antiderivatives to answer the following questions.

(a) Find the velocity function $v(t)$ of the object if its initial velocity is $v(0) = 3$.

(b) Find the position function $s(t)$ of the object if its initial position is $s(0) = 1$.
